SamePin

Find the right people to travel with

AI matching for solo travellers, and the shared plan that gets the trip off the group chat.

Pre-seed · Sahar Shahbazi · sahar.shahbazi.1@gmail.com · Toronto, Canada

Solo travellers have nowhere good to find a companion

Facebook groups and Reddit threads

A wall of posts with no way to tell whether someone travels like you do.

Advice from the wrong people

A backpacker and a luxury traveller asking about the same city need different answers.

Planning scattered everywhere

Screenshots in a group chat, a doc nobody opens, links lost three days back.

Match on how you travel, then plan it together

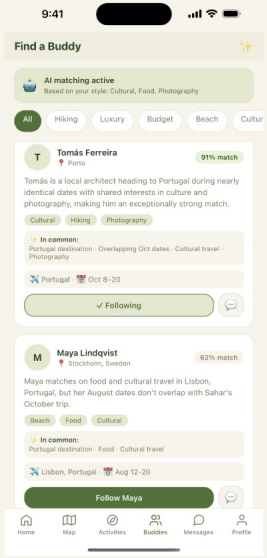

SamePin scores compatibility on destination, dates, budget and travel style — and explains why — then carries the trip through itineraries, shared ideas and group chat.

How it works

01

Match

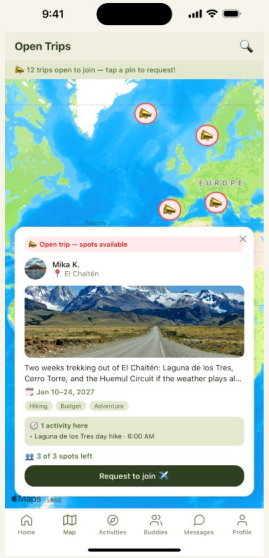

AI scores every traveller against your style and dates, with a plain-language reason.

02

Join a trip

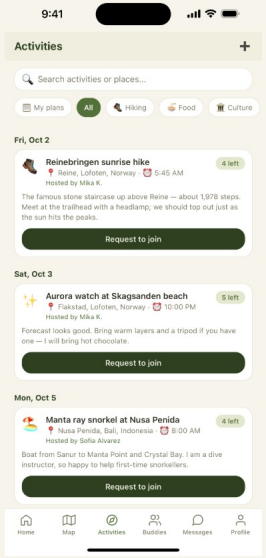

Open trips on a world map — see who is going where, and ask to come along.

03

Meet up

Post an activity or join one nearby; approved travellers land in a group chat.

Built and working today

Social layer

- AI buddy matching with cached scores
- Follows, private accounts and follow requests
- Direct and group chat, with voice messages
- Reporting, blocking and message privacy controls

Planning layer

- AI itineraries built from your own brief
- Shared trips with tagged collaborators
- An idea pool, slotted into days when plans firm up
- Open activities that join into trip groups

React Native · Supabase · Anthropic API

Why now

[__%]

Solo travel is mainstream

[Share of travellers going solo, and growth — cite your source.]

AI

Matching got cheap

Scoring every traveller and drafting real itineraries was not economic two years ago.

[$__B]

Nobody owns this

[Market size for the segment you are claiming — cite your source.]

Business model

Stream	What it is	When
SamePin Plus	Unlimited AI itineraries, deeper matching, profile insights — [$__/month]	At launch
Booking commission	Affiliate revenue on stays and tours already inside itineraries	Once trips scale
Operator listings	Local guides pay to post activities where travellers already are	City by city

AI costs are real per user, so pricing is tied to usage from day one. Match scores are cached and regenerate only when a profile changes.

Where we are

Built, solo

A complete iOS app: matching, messaging, itineraries, activities, moderation and privacy controls — designed and shipped by one founder.

Production ready

Running on Supabase with row-level security, server-side AI, push notifications and reporting built in — not a prototype.

Next step

TestFlight beta, then the App Store. We will measure matches that become conversations, trips that gain a second member, and week-four retention.

What comes next

NOW

Beta and launch

TestFlight with a first group of travellers, then the App Store.

NEXT

Density in a few cities

Matching only works where trips overlap, so growth starts city by city rather than everywhere at once.

THEN

Android and paid tier

Once retention holds, open the second platform and turn on subscriptions.

SamePin

Travel is better with the right people

Launching on the App Store this year. I would welcome a conversation.
